

SERVICE CATALOGUE · 2026

Professional repair, automation and modification of boiler plants, burners and industrial equipment

Service, repair and retrofit of boiler plants of any capacity, industrial burners, CO₂ automation systems, pumps, generators, screw air compressors and PLC/MCC control panels — for buildings, production plants, factories, agro complexes and asphalt plants.

15+
years of experience

100%
work under warranty

emergency response

30%
fuel savings, up to

HOW THIS CATALOGUE IS BUILT

Industrial heat engineering in Azerbaijan since 2008

One engineering team, seven directions: diagnostics, overhaul, modernisation (retrofit) and scheduled maintenance. Our goal is uninterrupted operation of your equipment, maximum energy efficiency and complete safety.

03	Us in numbers	experience · warranty · savings
04	Services 01–03	boiler plant · burner · CO ₂
05	Services 04–07	pump · compressor · generator · panel
06	Digital flue gas analysis	O ₂ · CO · CO ₂ · NO _x
07	Service models and FAQ	one-off · contract
08	Industries served	plant · agro · industry · building
09	Certificates and brands	licences · accreditations
10	Clients and site work	from the field
11	Contact and workflow	call-out · audit · execution

Restoring equipment to its rated operating mode is the backbone of every service we offer. Calibrating a burner, retrofitting a panel and inspecting on a schedule are often many times cheaper than new equipment — and deliver the same result.

US IN NUMBERS

Experience, warranty and measurable savings

15+

Years of Experience

Successful work in the service sector since 2008 and deep engineering experience in repairing boiler and industrial equipment.

100%

Work Under Warranty

A warranty commitment on all repair, modification and spare part replacement work.

24/7

Emergency Response

A rapid mobile service crew so production or the facility never stops.

30% max

Fuel Savings

Maximum efficiency from precise burner calibration and conversion to electronic modulation (retrofit).

CAPACITY RANGE • ∞

Full technical service from small central heating systems to large industrial steam boilers, 20 MW boiler plants and asphalt plant burners. Mechanics, combustion and automation — all in one team.

OUR CORE SERVICES

The heat source and the **combustion process**

Complete Service, Repair and Seasonal Preparation of Boiler Plants

Complete maintenance, diagnostics and overhaul of boiler plants of any capacity and type (hot water, steam, thermal oil).

Chemical and mechanical cleaning of internal and external boiler surfaces from scale and deposits, adjustment of safety valves and automatic control panels, full preparation for the season. By spotting potential failures early we prevent unplanned production stoppages.

Repair, Modification and Retrofit of Industrial Burners

Professional repair, testing and calibration of gas, diesel, heavy oil and combined (multi-fuel) burners.

We modernise worn burners with mechanical control (retrofit), moving them to microprocessor electronic control and servo-driven air-fuel ratio systems. Tuning combustion with digital gas analysers, we cut CO and CO₂ emissions to a minimum and achieve 15–30% fuel savings.

Sensor and Automation Upgrades for CO₂ Units in Agro Complexes

In greenhouses and agro complexes a CO₂ level above or below the norm both harms the crop and endangers the staff.

We build automation for CO₂ generators and dosing lines from scratch or upgrade existing systems: calibration of sensitive CO₂ sensors, integration of automatic gas leak safety valves and connection to the central control system (PLC).

OUR CORE SERVICES

Mechanics, power and automation

Technical Service of Circulation and Booster Pumps

Repair and preventive service of circulation, booster, fire-fighting and drainage pumps.

Diagnostics of vertical, horizontal and centrifugal pumps, replacement of mechanical seals and bearings, dynamic rotor balancing, motor winding checks and tuning of variable frequency drives (VFD). We remove the risk of cavitation and cut power consumption.

Service and Overhaul of Screw Air Compressors

When the screw compressor feeding compressed air to pneumatic equipment stops, the whole line stops with it.

Scheduled service (oil, air and separator filters), overhaul of the air-end, valve restoration, cleaning of cooling radiators and tuning of pressure sensors. We prevent overheating and pressure drops.

Service of Industrial Generators and Repair of Control Panels

When the grid fails, the instant start of the diesel and gas generators powering the facility is critical.

Engine and alternator diagnostics, adjustment of automatic transfer switches (ATS), programming of control boards, load testing and periodic oil and filter changes.

Industrial Automation: Building and Programming PLC/MCC Panels

Building from scratch, retrofitting and rapid repair of distribution, automation and PLC/SCADA control panels — to IEC/EN standards.

PLC/HMI/SCADA boards, power and distribution panels (MCC/MDB), generator automation (ATS/AMF), VFD integration for 20–40% electricity savings, and calibration of sensors and actuators.

NO TUNING WITHOUT MEASUREMENT

Maximum efficiency and minimum emissions through digital flue gas analysis

Fuel judged by spectral instruments, not by eye. With a calibrated analyser we measure CO, CO₂, NO, NO_x and O₂, then set the air-to-fuel ratio precisely from the control panel (through the servo motors).

O₂

3–4%

Oxygen · target range

CO

ppm ↓

Carbon monoxide · to a minimum

CO₂

Max ↑

Carbon dioxide · peak

NO_xLow-NO_x

Nitrogen oxides · within norm

Oxygen (O₂) — the key to the air ratio

Too much free oxygen means excess air is heated and thrown out of the stack — lost energy; too little means the fuel does not burn completely. By setting the air damper precisely we bring O₂ to its ideal level (3–4% for natural gas).

Carbon dioxide (CO₂) — combustion quality

A peak CO₂ reading in the stack shows the fuel is burning ideally. For maximum CO₂ yield we bring the air and fuel inputs into full balance.

Carbon monoxide (CO) — the hidden fuel loss

Incomplete combustion produces carbon monoxide — unburnt money going straight into the air, plus a poisoning risk. Bringing CO down to ppm level, we turn fuel into energy at close to 100% efficiency.

Nitrogen oxides (NO, NO_x) — the environment

When the combustion chamber runs too hot, harmful NO_x gases form. By shaping the flame and controlling its temperature we meet Low-NO_x standards.

WHAT THE BUSINESS AND THE ENVIRONMENT GAIN

01 Large savings on fuel

A badly tuned industrial burner burns tonnes of extra fuel or thousands of extra cubic metres of natural gas a year. Tuning with an analyser stops that loss immediately.

02 Longer equipment life

Fuel that does not burn completely leaves soot on the boiler tubes. A 1 mm layer of soot weakens heat transfer by 10%. Analysis keeps the tubes clean.

03 Environmental standards and protection from fines

Bringing CO and NO_x in line with international environmental norms and submitting an official flue gas analysis report to the state environmental inspectorate.

SERVICE MODELS

Choose the **service model** that fits you

CRITERION	One-off repair and service	Periodic (contract) maintenance MAXIMUM SAVINGS
PURPOSE OF THE SERVICE	Clear the current fault or breakdown	Prevent breakdowns before they happen
RESPONSE TIME	Prompt call-out in order of requests	Priority 24/7 response, immediately
FINANCIAL PLANNING	Unexpected costs at the moment of failure	A known, fixed annual or monthly budget
EQUIPMENT LIFE	Short-term recovery	Maximum service life and high efficiency
FUEL SAVINGS	Limited to the part that was repaired	Maximum savings through continuous calibration

FREQUENTLY ASKED QUESTIONS

Why does retrofitting a burner matter?

On old mechanically controlled burners the air-to-fuel ratio cannot be set precisely. A retrofit installs digital control and servo motors, which gives complete combustion and 15–30% savings.

How often should flue gas analysis be carried out?

At industrial plants and large boiler houses, at least four times a year (at the seasonal changeovers). It is also required whenever fuel quality changes or after repair work.

Why sign a maintenance contract instead of paying per repair?

During periodic service our engineers catch small faults early. That prevents sudden production stoppages and the far more expensive repairs that follow them.

INDUSTRIES SERVED

The facilities and industries we serve

Asphalt Plants and Aggregate Facilities

Emergency repair of high-capacity asphalt plant burners (diesel, heavy oil, natural gas or combined), calibration of the combustion chamber, cleaning of flame sensors and optimal tuning of the gas-air mixture.

Agro Complexes and Greenhouse Facilities

Uninterrupted service of greenhouse CO₂ control systems, large heating plants, irrigation and booster pump stations.

Factories and Industrial Plants

Repair and retrofit of the steam and thermal oil boilers, high-pressure screw air compressors, industrial burners and MCC panels that keep production lines running.

Residential Buildings, Hotels and Business Centres

Complete servicing of central heating and hot water plants, booster pumps, circulation systems and standby generators.

CERTIFICATES AND LICENCES

International standards and our official licences

Official licences from the Ministry of Economy

Official licences for installation, commissioning and repair at hazardous facilities (steam and hot water boilers, pressure vessels), and for diagnostics and inspection of technical installations.

EMERGENCY CALL-OUT AND ENGINEER INSPECTION

Is something wrong with your systems, or do you want **fuel savings?**

Contact us to have our engineer inspect your site, audit the existing equipment and prepare a technical and commercial proposal for you.

EMERGENCY LINE **+994 55 411 33 66**

MOBILE / WHATSAPP **+994 55 348 76 75**

E-MAIL **info@heat.az**

WEB **heat.az**

ADDRESS **10C A. Navai str., Babek ave., Baku**

WORKING HOURS **Mon–Sat 09:00–18:00 · Emergency line 24/7**

HOW WE WORK

- 01 A call or WhatsApp message — a short note on the equipment type and the problem.
- 02 An engineer inspects the site and audits the existing equipment.
- 03 A technical and commercial proposal: scope of work, spare parts, timeline.
- 04 Execution, testing and final tuning against flue gas analysis.
- 05 Warranty and, if you wish, a periodic maintenance contract.
